FOUNDER OS

Startup Finance & Investor Dashboard

A practical operating system for founders and small teams

Run your startup from one workspace.

Organise finance, investor relationships, projects, KPIs, tasks, decisions, risks, and management reporting in one place.

FINANCE

Transactions, revenue, expenses and runway

INVESTORS

Investor register and funding records

OPERATIONS

Tasks, milestones, decisions and risks

REPORTING

KPIs and daily-to-yearly snapshots

Founder OS - Startup Finance & Investor Dashboard

Start here

Welcome to Founder OS. This reusable Notion workspace helps founders organise finance, investors, projects, operating tasks, KPIs, decisions, risks, and management reporting.

Quick setup

1. **Make this workspace yours:** rename the business-specific labels and add your company name, logo, and preferred currency.
2. **Review every database:** update the properties, options, views, and formulas to match your workflow.
3. **Replace sample or placeholder data:** do not treat example entries or empty dashboards as real financial results.
4. **Set up your operating rhythm:** assign task owners, enter project milestones, add recurring expenses, and schedule weekly reviews.
5. **Configure integrations separately:** payment syncing, automatic reporting, and alerts are not included just because this template is duplicated.
6. **Protect confidential data:** limit access to investor details, contracts, and financial records. Share a separate read-only summary when appropriate.

What is included

- Transactions and revenue tracking
- Investor register and funding records

- Tasks and action items
- Product roadmap
- KPI and reporting snapshots
- Expenses and runway planning
- Decisions, meetings, and updates
- Risks and issues register

Important: This is a Notion template, not a financial, legal, or investment advisory service. Check formulas and financial reports before relying on them. Any payment-provider integration must be built and tested separately.

A practical operating system for startup founders, solo operators, and small teams. Use it to organise business finances, investor relationships, performance metrics, projects, decisions, risks, and reporting in one workspace.

Executive dashboard

Use this page as the central dashboard for your business operations and investor records.

Financial overview

- Gross revenue — total successful payments before deductions.
- Net receipts — amount received after payment processing fees, refunds, reversals, and other applicable deductions.
- Transactions — successful, pending, failed, refunded, and disputed payments.
- Revenue trends — daily, weekly, monthly, quarterly, and yearly.
- Product metrics — paying users, average transaction value, repeat purchases, and revenue by product or plan.

Important: These figures should come from verified payment records. Until a payment integration is implemented, manually entered figures are placeholders

and must not be represented as live data.

Navigation

1. Finance & payments

Maintain a transaction ledger, revenue summaries, refunds, payment fees, reconciliation notes, and reporting periods.

2. Investor relations

Track investor profiles, commitments, amounts received, equity or instrument terms, signed documents, reporting dates, and communications. Restrict access to confidential records.

3. Performance & growth

Track key metrics such as registrations, active users, paying users, conversion rate, retention, average revenue per user, and API cost per generated document.

4. Operations

Track priorities, tasks, product milestones, decisions, risks, blockers, and meeting notes.

5. Reports

Prepare daily snapshots, weekly summaries, monthly management reports, and quarterly/yearly investor updates.

Payment integration — implementation plan

This template does not include a live payment-provider integration. Automated syncing requires a separate integration or backend service configured for your payment provider.

Recommended flow:

1. Your payment provider sends payment events to a secure backend webhook.
2. The backend verifies the event and confirms the transaction with the payment provider where appropriate.

3. It stores the transaction in a database, deduplicates webhook events, and handles refunds/reversals.
4. A scheduled job or approved integration publishes sanitised transaction records and aggregated metrics to Notion.
5. Dashboard reports use successful, verified transactions and clearly separate gross revenue from net receipts.

Security: Never store payment-provider secret keys, webhook secrets, customer card data, or other credentials in Notion. Keep secrets in server-side environment variables or a secrets manager. Notion should be a reporting interface, not the payment system of record.

Reporting definitions

- **Gross revenue:** value of successful, non-reversed customer payments, using a consistent accounting policy.
- **Net receipts:** gross receipts minus applicable payment processing fees, refunds, reversals, and chargebacks.
- **Pending:** initiated or processing payments that are not yet confirmed successful.
- **Daily / weekly / monthly / yearly:** group by the transaction's verified timestamp, using Africa/Lagos time for operating reports unless the finance policy specifies otherwise.
- **Reconciliation:** compare recorded transactions with your payment-provider settlement reports and actual bank receipts.

Operating rules

- Do not count pending or failed payments as revenue.
- Do not treat an investor's capital contribution as customer revenue; record it separately as funding.
- Keep a record of refunds, reversals, fees, and settlement differences.
- Include a last-synced timestamp and integration status in every live report.

- Give investors access only to the information they are authorised to see. A shared Notion page is not a row-level security system; use separate views/workspaces or a dedicated investor portal when different investors must see different private information.

Launch checklist

- [ ] Confirm the metrics and accounting definitions.
- [ ] Create the transaction ledger and operating databases.
- [ ] Decide which fields are safe for investors to see.
- [ ] Build and test the payment-provider webhook/backend.
- [ ] Test duplicate events, pending payments, failed payments, refunds, reversals, and settlement differences.
- [ ] Validate daily, weekly, monthly, and yearly totals against your payment provider.
- [ ] Add a last-sync timestamp and error alerting.
- [ ] Publish investor-facing reports only after reconciliation checks pass.

📈 KPI & Reporting Snapshots

🧾 Expenses & Runway

🧠 Decisions, Meetings & Updates

⚠️ Risks & Issues

How to use this office

🧭 Start with the transaction ledger, investor register, tasks, and roadmap. Keep the system lean: add detail when it helps a decision, report, or follow-up.

Weekly operating rhythm

- **Daily:** review payment exceptions, failed or pending payments, new tasks, and urgent blockers.
- **Weekly:** reconcile payment transactions, review revenue and AI/API spend, update roadmap status, and assign next actions.
- **Monthly:** prepare a management summary covering revenue, net receipts, costs, user growth, product delivery, risks, and investor follow-ups.
- **Quarterly / yearly:** review strategy, funding runway, product outcomes, ownership records, and investor reporting.

Investor register rules

- Record each investor's commitment and the amount actually received separately.
- Enter **Equity %** only when supported by the signed agreement or approved cap table. Do not infer ownership percentage from the amount invested alone.
- Record instrument type and terms clearly; loans, grants, convertible instruments, and equity are not interchangeable.
- Keep signed agreements and personal contact details restricted to authorised operators. Share only approved summaries with investors.
- If investors have different access rights, do not share this entire office with all investors. Use separate investor-facing pages or a dedicated portal.

Revenue reporting rules

- Use the transaction's verified payment timestamp and Africa/Lagos time for operating reports.

- Count only confirmed successful payments as gross customer receipts; exclude pending and failed transactions.
- Track refunds, reversals, fees, chargebacks, and settlement differences separately.
- Keep investor capital contributions separate from product/customer revenue.
- Use the **KPI & Reporting Snapshots** database for daily, weekly, monthly, quarterly, and yearly summaries. Mark a snapshot verified only after checking its source.
- The **Revenue Trend** chart groups transaction records by day. It is not a live report unless the ledger is populated with verified records and a payment sync is implemented.

Payment integration status

Status: Not connected by default. Creating these Notion databases does not grant payment-provider access or make figures live.

Implementation path:

1. Build a secure server-side webhook endpoint in your application backend.
2. Verify webhook signatures and confirm transactions with your payment provider as appropriate.
3. Store the canonical transaction in the application's database; use the provider's transaction reference to prevent duplicate records.
4. Handle successful, pending, failed, refunded, reversed, and disputed events.
5. Calculate daily, weekly, monthly, quarterly, and yearly aggregates in the backend using Africa/Lagos time.
6. Sync only necessary, sanitised transaction fields and aggregate metrics into Notion through the Notion API.
7. Reconcile totals against provider settlement records; show a last-sync timestamp and alert on failures.

Security: never put payment-provider secret keys, webhook secrets, customer card details, or other credentials in Notion. Keep secrets in server-side

environment variables or a secrets manager. Use the application's database as the source of truth and Notion as the operating/reporting interface.

Initial setup checklist

- [ ] Confirm the signed investment terms and current ownership records.
- [ ] Add authorised investors and team members; avoid putting sensitive details in broadly shared pages.
- [ ] Enter real roadmap milestones, owners, dates, and measurable success criteria.
- [ ] Add recurring operating costs, including model/API and hosting spend.
- [ ] Test the transaction ledger and reporting views with clearly labelled sample data before relying on them.
- [ ] Implement and test the payment-provider-to-backend-to-Notion sync.
- [ ] Reconcile reporting totals before sharing investor reports.
- [ ] Create a separate investor-facing report with only approved information.

Template note

This template is an operational workspace, not a legal cap table, regulated accounting system, or payment processor. Verify financial statements, ownership records, and investor disclosures against signed documents and source records. All sample figures should be replaced with your own data.
